

Javascript, Application ToDo

Requirements

None

Setup

1. Clone the repository

Launch

If you have done everything right, you should be ready to launch the app.

Double click on the `todo.html` file, it should now be opened in your default internet browser.

How to use ?

Add a task

- Enter the task in the "*Enter task name*" text box
- Press Submit

Remove a task

- Press the bin next to the task you wish to remove.

Edit a task

- Press the pen next to the task you wish to edit
- Enter the new name of the task in the text box.
- Press Submit to change the name with the value you just entered or press Cancel to discard changes.

Mark a task as done or not done

- Press the box containing Done or Not done next to the corresponding task. The status the task will take is written.

Filter

- Press the filter dropdown menu.
- Select the filter you wish to apply.

Sort

- Press the sort dropdown menu.
- Select the sorting you want to apply.

Move a task

- Click on the task you wish to move
- Drag and drop it on its new emplacement

Export a list

- Press the Export button
- Save file on your computer

Import a list

- Press the browse button
- Select an existing list (*.json file*)

- Press the Import button

Notes

If a task is done, its name is crossed.

The folder `lists` already contains an example list for you to import.

A file containing a list is in `.json`.
